

2-2: Piecewise Functions

I would like you to make up your own story that matches the graph below:

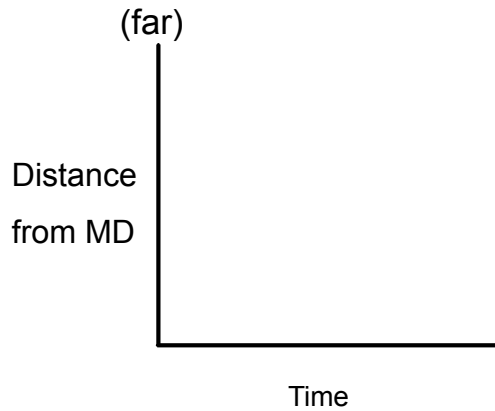

Here's my story: A penguin was sleeping in a snowdrift when it was awakened by a polar bear. It ran quickly to a hiding place where it waited for the bear to pass by. Then it walked slowly back towards the snowdrift. The bear jumped out from behind a large rock and ate him before he got there.

I would like for you to draw a position vs. time graph of your day. You start at home then come (very quickly because you're late) to school early in the morning and stay here for 7 hours. You then go to your friends' house and stay there for 2 hours. You then walk slowly home.

Motion Detector Task!

1. Prediction: Start far away, walk towards MD

2. Prediction: Stand still, then start walking away

3. Prediction: Walk towards it quickly, then walk slowly away.

4. Prediction: Start half way, walk away, stand still, then quickly walks towards

Given:

Actual:

Bob started far away. Then he quickly ran towards the detector. Then he stopped. Then he walked away slowly. Then he stopped.

Prediction:

Actual:

Piecewise Function: A function whose definition changes depending on the value of the independent variable.

Recall: A function must pass the *vertical line test* (meaning two points cannot intersect a given vertical line at any point of the graph)

Example of what piecewise might look like:

Graphing a piecewise

2 points per piece (endpoints of interval)

$<$, $>$ open circles \circ

\leq , \geq closed circles \bullet

or arrow \rightarrow

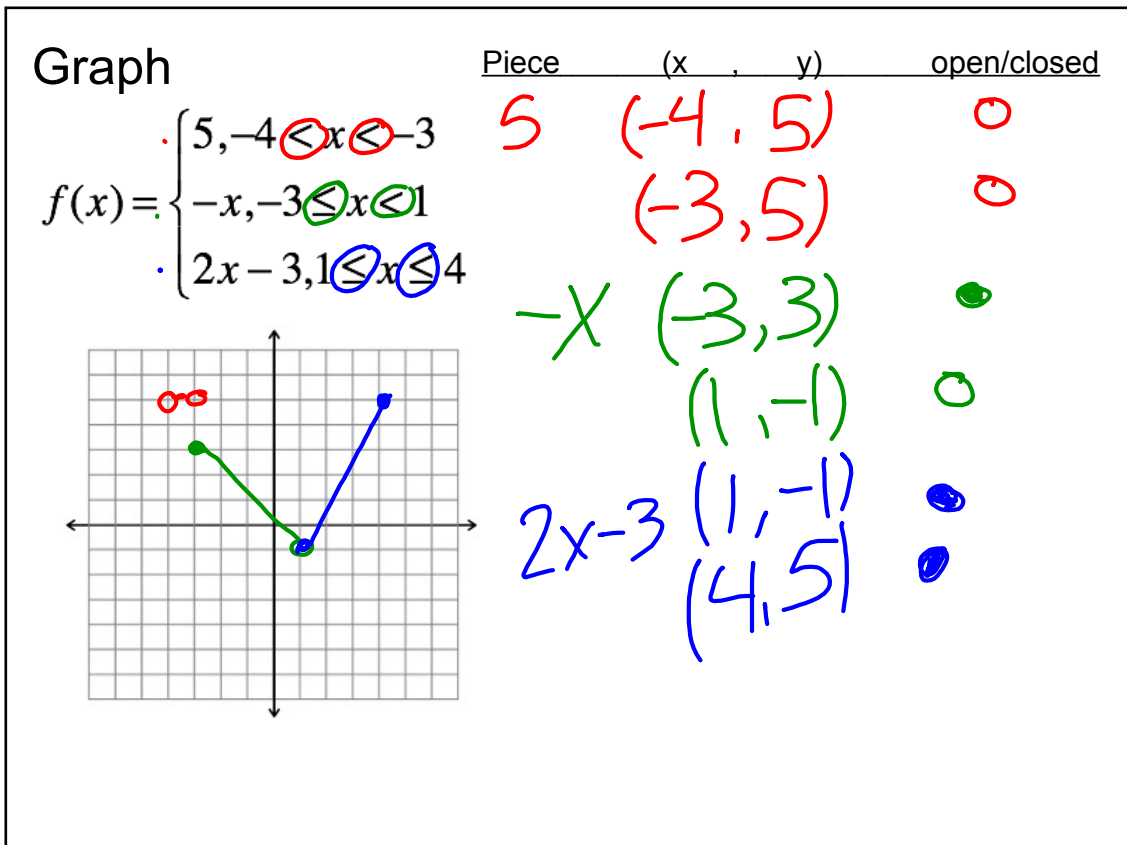

Piece $(x$, $y)$ open/closed

endpoint of interval

x plugged in = _____

Then graph the points and connect the pieces!!!

You Try:

$$f(x) = \begin{cases} x+1, & -5 < x \leq 1 \\ 3, & 1 < x < 4 \\ 2x-3, & x \geq 4 \end{cases}$$

Piece	(x, y)	open/closed
$x+1$	$(-5, -4)$	\circ
	$(1, 2)$	\bullet
3	$(1, 3)$	\circ
	$(4, 3)$	\circ
$2x-3$	$(4, 5)$	\bullet
	$(5, 7)$	\rightarrow

Remember:

$$\text{slope} = m = \frac{\text{rise}}{\text{run}} = \frac{y_2 - y_1}{x_2 - x_1}$$

Equations of a line:

point-slope form: $y - y_1 = m(x - x_1)$ then solve for y

Labels: 'point' points to (x_1, y_1) , 'slope' points to m .

slope-intercept form: $y = mx + b$

Labels: 'slope' points to m , 'y-intercept' points to b .

Find the equation of the line given the graph/
points:

$$\begin{array}{cc} x_1 & y_1 & x_2 & y_2 \\ (2, 4) & & (6, -8) \end{array}$$

$$\frac{-8-4}{6-2} = \frac{-12}{4} = \boxed{-3}$$

$$y-4 = -3(x-2)$$

$$y-4 = -3x+6$$

$$\boxed{y = -3x + 10}$$

Working Backwards!

1. Find the equation of each line (segment)
2. Determine the domain of each piece (don't forget to watch for open circles $<$, $>$ or closed circles \leq)
3. Write as a piecewise function

$$f(x) = \begin{cases} -3, & -5 \leq x < -1 \\ x-1, & x \geq -1 \end{cases}$$

$$\begin{aligned} y &= mx + b \\ y &= x - 1 \end{aligned}$$

Write the equation for the piecewise function:

$$f(x) = \begin{cases} -3x-10, & x \leq -3 \\ x+2, & -3 < x < -1 \\ -2, & -1 \leq x \leq 5 \end{cases}$$

$$m = \frac{\text{rise}}{\text{run}} = \frac{3}{-1} = -3$$

Point $(-3, -1)$

$$y - (-1) = -3(x - (-3))$$

$$y + 1 = -3(x + 3)$$

$$y + 1 = -3x - 9$$

$$y = -3x - 10$$

$y = mx + b$
 \downarrow slope \downarrow y-int
 $y = x + 2$

Distance from home (mi)

1. What is happening at time=2 h?

turned around

2. What is happening from time=0 h until time=2 h? What is the equation of this line?

heading home

$$y = -2x + 5$$

3. What is happening from time=2 h until time=3 h? What is the equation of this line? going away from home

$$y = 2x - 3$$

4. What is happening from time=3h to time=6h? What is the equation of this line? didn't move

$$y = 3$$

5. What is happening from time=6h to time=7h. What is the equation of this line? heading home

$$y = -3x + 21$$

6. Write an equation for this graph. Be sure to include the domain!!!

$$f(x) = \begin{cases} 2x+5, & 0 \leq x < 2 \\ 2x-3, & 2 \leq x < 3 \\ 3, & 3 \leq x < 6 \\ -3x+21, & 6 \leq x < 7 \end{cases}$$

5. a. turned around

b. going at a constant rate
(away from train station)

$$\begin{matrix} x_1, y_1 & x_2, y_2 \\ (0, 0) & (40, 250) \end{matrix}$$

$$\frac{250-0}{40-0} = \frac{250}{40} = \boxed{\frac{25}{4}}$$
